### 技术规格

<b>Background:</b>	This gene encodes a member of the steroid-thyroid hormone-retinoid receptor superfamily. Expression is induced by phytohemagglutinin in human lymphocytes and by serum stimulation of arrested fibroblasts. The encoded protein acts as a nuclear transcription factor. Translocation of the protein from the nucleus to mitochondria induces apoptosis. Multiple transcript variants encoding different isoforms have been found for this gene.

<b>Immunogen:</b>	Peptide sequence around phosphorylation site of Serine351 (L-P-S(p)-K-P) derived from Human Nuclear Receptor NR4A1.
<b>Full name:</b>	nuclear receptor subfamily 4, group A, member 1
