技术规格

| Background: | This gene encodes a signaling adaptor protein with two E H domains that interacts with proteins that participate in s ignaling, endocytosis and cytoskeletal changes. The encode d protein has been found in association with intersectin 1 and Src homology 3-domain growth factor receptor-bound 2-like (endophilin) interacting protein 1 when intersectin 1 was isolated from clathrin-coated pits. The encoded protein has also been shown to interact with amphiphysin, a cyt oplasmic protein at the surface of synaptic vesicles. Alternative splicing results in multiple transcript variants encoding different isoforms. |
