### 技术规格

<b>Background:</b>	The p21 activated kinases (PAK) are critical effectors that link Rho GTPases to cytoskeleton reorganization and nuclear signaling. The PAK proteins are a family of serine/threonine kinases that serve as targets for the small GTP binding proteins, CDC42 and RAC1, and have been implicated in a wide range of biological activities. The protein encoded by this gene is activated by proteolytic cleavage during caspase-mediated apoptosis, and may play a role in regulating the apoptotic events in the dying cell.

<b>Name of antibody:</b>	PAK2(Ab-197)
<b>Immunogen:</b>	Synthesized non-phosphopeptide derived from human PAK2 around the phosphorylation site of serine 62 (T-R-S(p)-V-I).
