Background	Immunoglobulin G (IgG) is one of the most abundant proteins in serum with normal levels between 8-17 mg/ml in adult blood. IgG is important for our defense against microorganisms and the molecules are produced by B lymphocytes as a part of our adaptive immune response. The IgG molecule has two separate functions; to bind to the pathogen that elicit ed the response and to recruit other cells and molecules to destroy the antigen. The variability of the IgG pool is generated by somatic recombi nation and the number of specificities in an individual at a given time p
