## 技术规格

Background:	This intronless gene is a member of the frizzled ge ne family. Members of this family encode seven-tra nsmembrane domain proteins that are receptors fo r the Wingless type MMTV integration site family o f signaling proteins. Most frizzled receptors are cou pled to the beta-catenin canonical signaling pathwa y. This gene is highly expressed in two human can cer cell lines, indicating that it may play a role in s everal types of cancer. The crystal structure of the extracellular cysteine-rich domain of a similar mous e protein has been determined.
