Background:	This gene encodes a protein that belongs to the inositol phosphokinas e (IPK) family. This protein is likely responsible for the conversion of i nositol hexakisphosphate (InsP6) to diphosphoinositol pentakisphosphat e (InsP7/PP-InsP5). It may also convert 1,3,4,5,6-pentakisphosphate (Ins P5) to PP-InsP4 and affect the growth suppressive and apoptotic activities of interferon-beta in some ovarian cancers. Alternative splicing results in multiple transcript variants encoding different isoforms.
