Background:	This gene encodes a member of the WD repeat protein family. WD repeats are minimally conserved regions of approximately 40 amino acids typically bracketed by gly-his and trp-asp (GH-WD), which may facilitate formation of heterotrimeric or multiprotein complexes. Members of this family are involved in a variety of cellular processes, including cell cycle progression, signal transduction, apoptosis, and gene regulation. This protein contains 5 WD repeats, and has a structural similarity with actin-binding proteins: the <i>D. discoideum</i> coronin and the human p57 protein, suggesting that this protein may also be an actin-binding protein that regulates cell motility. Alternative

splicing of this gene generates 2 transcript variants.
