Background:	Phosphatidylinositol 3,4,5-trisphosphate-dependent guanine nucleotid e exchange factor (GEF) which, independently of RAS, transduces sig nals from tyrosine kinase receptors to RAC. It also mediates signalin g of membrane ruffling. Regulates the actin cytoskeleton as an effector or adapter protein in response to agonist stimulated phosphatid ylinositol (3,4)-bisphosphate production and cell protrusion (By simil arity).
